

Creating a MyProxy Plugin for Joomla 1.7

This document describes how to create a [MyProxy](#) Plugin for [Joomla 1.7](#). See "[Creating an Authentication Plugin for Joomla 1.5](#)" for details of how-to-create custom authentication plugins.

For this, we need to create five files as following:

1. myproxy.xml
2. en-GB.plg_authentication_myproxy.sys.ini
3. en-GB.plg_authentication_myproxy.ini
4. myproxy.php
5. index.html (dummy)

Plug-in Manager's view in Joomla

After deploying the MyProxy plugin into Joomla, we can see the following view via Plug-in Manager. For this view, we create the manifest xml file and two language-files such as 'en-GB.plg_authentication_myproxy.sys.ini' and 'en-GB.plg_authentication_myproxy.ini'.

The screenshot shows the Joomla! administration panel with the title 'Administration' at the top. The main menu items include Site, Users, Menus, Content, Components, Extensions, Help, and Log out. Below the menu, there are status indicators: 1 Logged-in frontend, 1 Logged-in backend, No messages, View Site, and Help. The current page is 'Plug-in Manager: Authentication - MyProxy'. On the left, there is a sidebar with a yellow plug icon and the title 'Authentication - MyProxy'. It contains fields for Enabled (Enabled), Access (Public), Ordering (4. Authentication - MyProxy), Plug-in Type (authentication), Plug-in File (myproxy), and ID (801). A 'Description' section notes that it handles user authentication against a MyProxy server and warns that at least one plugin must be enabled. On the right, there is a 'Basic Options' section with fields for Host (topaz.kisti.re.kr), Port (7512), Lifetime (12), and Outfile Directory (/tmp). At the bottom of the page, a footer states 'Joomla!® is free software released under the GNU General Public License. Version 1.7.0'.

Create the XML install manifest and language files

The myproxy.xml

Basic options are set from field set name 'basic' in the right side of above figure.

```

<?xml version="1.0" encoding="utf-8"?>
<extension version="1.7" type="plugin" group="authentication">

site.</strong>"
```

Create myproxy.php file

The plgAuthenticationMyproxy Class

The onUserAuthenticate() Method

```

function onUserAuthenticate($credentials, $options, &$response)
{
    // Initialise variables.
    $success = 0;

    // For JLog
    $response->type = 'MYPROXY';
    // MYPROXY does not like Blank passwords (tries to Anon Bind which is bad)
    if (empty($credentials['password']))
    {
        $response->status = JAUTHENTICATE_STATUS_FAILURE;
        $response->error_message = JText::_('JGLOBAL_AUTH_PASS_BLANK');
        return false;
    }

    $myproxy_server = $this->params->get('host');
    $myproxy_port = $this->params->get('port');
    $username = $credentials['username'];
    $passphrase = $credentials['password'];
    $lifetime = $this->params->get('lifetime');
    $outfile = $this->params->get('outdir') . '/x509up_u' . $username;
    $DEBUG = false;
    $success = $this->myproxy_logon($myproxy_server, $myproxy_port, $username, $passphrase,
$lifetime, $outfile, $response, $DEBUG);

    if (!$success)
    {
        if (!strlen($response->status)) $response->status =
JAUTHENTICATE_STATUS_FAILURE;
        if (!strlen($response->error_message)) $response->error_message = JText::_('
JGLOBAL_AUTH_INCORRECT');
    }
    else
    {
        // Grab some details from MYPROXY and return them
        $response->username = $username;
        $response->email = $username . '@myproxy.server';
        $response->fullname = $username;

        // Were good - So say so.
        $response->status = JAUTHENTICATE_STATUS_SUCCESS;
        $response->error_message = '';
    }
}
```

The myproxy_logon() Method

We use a [myproxyClient.php](#) provided in the [MyProxy website](#). This allows anonymous user to retrieve credentials from a MyProxy Server.
