

Add

<add>

Purpose/Function

Invoke the `add[OgreScript:Property]` method on the putative bean object. Bean object should be dereferenced from the environment.

Attributes

NAME	TYPE	DEFAULT VALUE	DESCRIPTION
<i>bean</i>	<code>java.lang.Object</code>	(required)	bean on which to invoke method
<i>property</i>	<code>java.lang.String</code>	(required)	name of property for which value should be added

See also note below.

Elements

See note below.

ReturnValues

None.

NOTE:

This class subclasses [<assign>](#), so the latter's attributes (excepting *name* and *global*) may be applied; the default value for *configured* here is `true`. Child elements also function as they do for [<assign>](#).

Examples

```
<add bean="${bean1}" property="addSomeValue" object="${someValue}" />

<add bean="${bean2}" property="addSomeValue">
  <deserialized>${someXML}</deserialized>
</add>

<!-- etc. -->
```
