

# Mark McKenney

This project will develop flexible education modules that cover key foundational concepts of cyberGIS; these modules can be used together as an extended module in a single course, or broken into smaller stand-alone modules that compliment concepts in traditional computing courses. The result is that the modules may be integrated into existing curricula in an effort to expose students to cyberGIS fundamentals, or used together as an intensive foundation for cyberGIS. The modules will use free and open-source software, freely available data, and can be run on standard desktop computers, allowing the use of the modules in a wide range of settings.
