2016-01-26 Nebula Maintenance

On Tuesday, January 26th from 10:00am to 12:00pm the Nebula web interface and API interfaces will be unavailable for maintenance.

We will work on:

- Software and security updates
- Look at reducing snapshot sizes
- Poking and prodding in preparation for future network upgrade

Instances and networking to those instances will continue to work as expected during the maintenance time. Functions that try to provision new instances or volumes will not work, however.

Maintenance was completed at 12:00pm CST

All compute nodes were changed to use the QCOW2 for snapshots instead of RAW, so they should be smaller and faster.

Security updates were installed on public-facing systems.
