FABRIC: A great opportunity to participate in the advancement of networks and services to further discovery

NCSA's Cybersecurity and Networking Division (CSND) will be working on a newly announced project called FABRIC. FABRIC is "a unique national research infrastructure to enable cutting-edge and exploratory research at-scale in networking, cybersecurity, distributed computing and storage systems, machine learning, and science applications." In a press release announcing the project, CSND's David Wheeler said, "Through supporting a FABRIC Edge node with our high capacity Wide Area Network to the nationwide infrastructure, this is a great opportunity for the University of Illinois, NCSA, and XSEDE to participate in the advancement of networks and services to further discovery."

More details about FABRIC, including NCSA's unique role in the project, are available in the NCSA press release.
